## Signature Capture

*For access control*

The SigniShell™ captures and calculates the pressure, acceleration, speed and rhythm used in the act of signing to create a distinctive personal profile for each signature. Upon capture, signatures are profiled, encrypted and compressed, and then stored in a database system, smart card or token device. The SigniShell technology learns the variations in a person's signature to recognize a user's authentic signature, despite slight variations. *Card Scanning Solutions.*
